# What's the Internet: "nuts and bolts" view

UT/EWI/DACS/PTdB, 20161011

Introduction 1-4  
Pearl 101 - networks :2

# What's the Internet: "nuts and bolts" view

- ❖ *Internet: "network of networks"*
  - Interconnected ISPs
- ❖ *protocols* control sending, receiving of msgs
  - e.g., TCP, IP, HTTP, Skype, 802.11
- ❖ *Internet standards*
  - RFC: Request for comments
  - IETF: Internet Engineering Task Force

Introduction 1-6  
Pearl 101 - networks :3

UT/EWI/DACS/PTdB, 20161011

# Internet structure: network of networks

**Question:** given millions of access ISPs, how to connect them together?

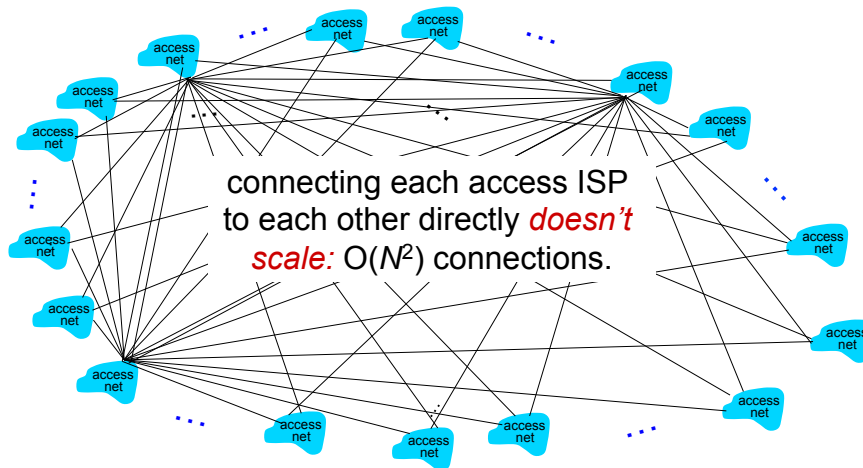

UT/EWI/DACS/PTdB, 20161011

Pearl 101 - networks :4

## Internet structure: network of networks

*Option: connect each access ISP to every other access ISP?*

## Internet structure: network of networks

*Option: connect each access ISP to a global transit ISP? Customer and provider ISPs have economic agreement.*

## Internet structure: network of networks

But if one global ISP is viable business, there will be competitors

....

## Internet structure: network of networks

But if one global ISP is viable business, there will be competitors

.... which must be interconnected

## Internet structure: network of networks

... and regional networks may arise to connect access nets to ISPs

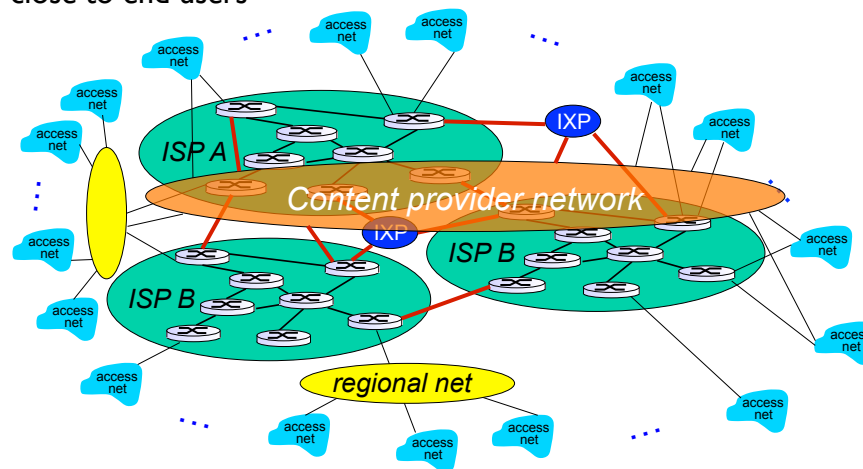

UT/EWI/DACS/PTdB, 20161011

Pearl 101 - networks :9

## Internet structure: network of networks

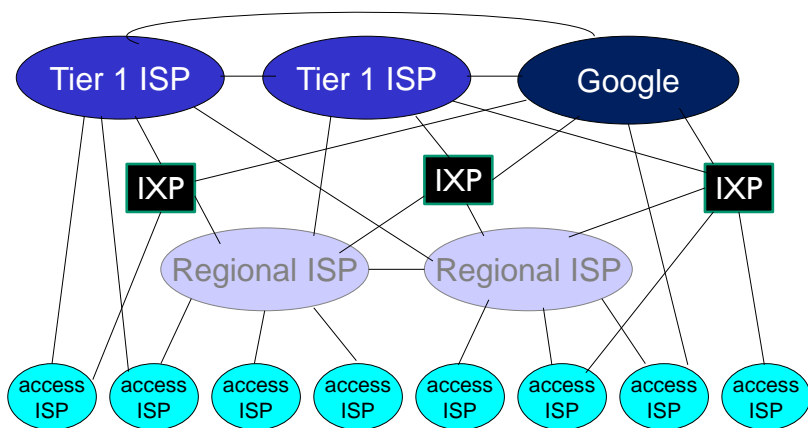

... and content provider networks (e.g., Google, Microsoft, Akamai) may run their own network, to bring services, content close to end users

UT/EWI/DACS/PTdB, 20161011

Pearl 101 - networks :10

## Internet structure: network of networks

- ❖ at center: small # of well-connected large networks
  - “tier-1” commercial ISPs (e.g., Level 3, Sprint, AT&T, NTT), national & international coverage
  - content provider network (e.g., Google): private network that connects its data centers to Internet, often bypassing tier-1, regional ISPs

Introduction 1-40

Pearl 101 - networks :11

## Packets vs. circuits

Two methods for organizing communication in a network:

- ▶ circuit-switching: for each connection between two endpoints a *part* of the link speed is reserved.  
Very suitable if the users need a constant number of bits per second; e.g. telephony.
- ▶ packet-switching: information flows through the network as packets, which *one after the other* are sent at the *full* link speed.  
Very suitable if the users' needs are very variable; e.g., internet traffic

UT/EWI/DACS/PTdB, 20161011

UT/EWI/DACS/PTdB, 20161011

Pearl 101 - networks :12

## What is a packet?

- ▶ A packet is a block of bits, which are transmitted over a communication link to transport data from one place to another.
- ▶ Length typically is variable, but upper-bounded.
- ▶ A packet typically contains *data* and a *header*.
- ▶ The header contains control information, e.g. about where the data should go.

UT/EWI/DACS/PTdB, 20161011

Pearl 101 - networks :13

## Layering

- ▶ Networked systems often use a *layered* design.
- ▶ Each layer *uses* the service from the layer *below* it, to *provide* a better / more useful / more complete service to the layer *above* it.
- ▶ Each layer may introduce its own header.
- ▶ “One layer’s header is (part of) another layer’s data.”

UT/EWI/DACS/PTdB, 20161011

Pearl 101 - networks :14

## Internet protocol layers

Layer	Service provided	Internet example
Application	User applications such as web, e-mail, etc.	HTTP, SMTP, etc.
Transport	Reliable delivery of byte stream (Unreliable delivery of packets)	TCP (UDP)
Network	Unreliable delivery of packets throughout a network	IP
Link	Unreliable delivery of packets to neighbour node	Ethernet, WiFi, etc.
Physical	Unreliable delivery of bits to neighbour node	fiber/copper cable, radio channel, etc.

UT/EWI/DACS/PTdB, 20161011

# What's a protocol?

a human protocol and a computer network protocol:

UT/EWI/DACS/PTdB, 20161011

Introduction 1-9  
Pearl 101 - networks :18

## Example protocol for web browsing: HTTP

Request:

```
GET /onderwijs/ewi/index.html HTTP/1.0
Host: www.utwente.nl
User-agent: Mozilla/4.0
```

Reply:

```
HTTP/1.0 200 OK
Content-Length: 12345
Content-Type: text/html

</html>
```

UT/EWI/DACS/PTdB, 20161011

Pearl 101 - networks :19

## Question

Approximately how many computers are connected to the Internet nowadays?

- A. 1000 000
- B. 10 000 000
- C. 100 000 000
- D. 1000 000 000
- E. 10 000 000 000
- F. 100 000 000 000
- G. 1000 000 000 000

UT/EWI/DACS/PTdB, 20161011

Pearl 101 - networks :20

## Addressing

Computers on the internet (“hosts”) are identified by an *address*: a 32-bit number, for example

10000010 01011001 00000011 11111001

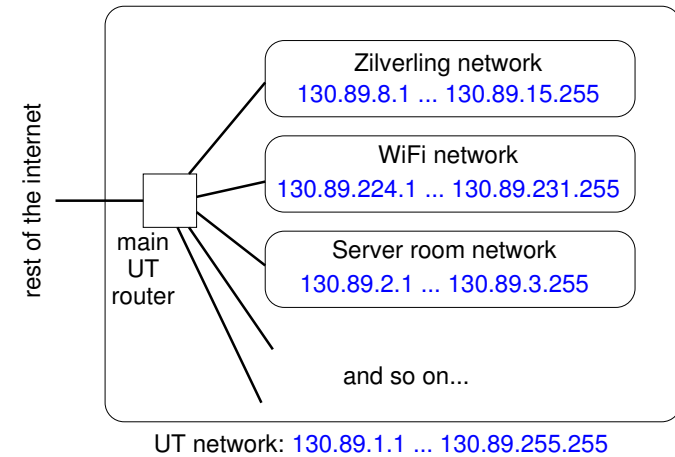

For convenience, this is usually written down in decimal, for example 130.89.3.249.

Addresses are assigned *systematically*; e.g., all addresses starting with 130.89 are on the University of Twente.

The above is about IP version 4; version 6 has 128 bits, but is not used much yet.

For human convenience, many hosts also have a *name*, for example [www.utwente.nl](http://www.utwente.nl). Converting names to IP addresses and vice versa is done by the Domain Name System (DNS).

## Addresses are assigned systematically

Each sub-network has a subset of the UT’s full address range.

Routers outside the UT only need 1 entry in their forwarding tables for the entire UT; subnetworks are handled within the UT.

## Addressing within a host

- ▶ Multiple flows of data can exist simultaneously between two hosts.  
⇒ also at the transport layer a form of addressing is needed.
- ▶ Transport layer header contains **port number**, of 16 bits.
- ▶ A TCP connection is uniquely identified by the IP addresses on both sides and the port numbers on both sides.
- ▶ Some port numbers are associated with specific applications. Other port numbers are used temporarily.

## Dealing with packet loss

Packets can be lost on their way.

Therefore:

- ▶ Data packets contain a sequence number.
- ▶ Separate packets in the reverse direction confirm correct reception.
- ▶ Data packets which are lost, are retransmitted.

## Dealing with packet loss

Many variations possible:

- ▶ seq.nr. count packets or bytes?
- ▶ ack.nr. is last received or next expected?
- ▶ can have multiple packets outstanding?
- ▶ and if so, retransmit all or one on timeout?
- ▶ sender has timeout, or receiver asks sender to repeat?

Needs a protocol!

In the pearl assignment, you'll explore how TCP does this.

UT/EWI/DACS/PTdB, 20161011

Pearl 101 - networks :25

## How do loss and delay occur?

packets *queue* in router buffers

- ❖ packet arrival rate to link (temporarily) exceeds output link capacity
- ❖ packets queue, wait for turn

UT/EWI/DACS/PTdB, 20161011

Pearl 101 - networks :26

## Four sources of packet delay

$$d_{\text{total}} = d_{\text{proc}} + d_{\text{queue}} + d_{\text{trans}} + d_{\text{prop}}$$

$d_{\text{proc}}$ : processing

- check bit errors
- determine output link
- typically < msec

$d_{\text{queue}}$ : queueing delay

- time waiting at output link for transmission
- depends on congestion level of router

UT/EWI/DACS/PTdB, 20161011

Introduction 1-44  
Pearl 101 - networks :27

## Four sources of packet delay

$$d_{\text{total}} = d_{\text{proc}} + d_{\text{queue}} + d_{\text{trans}} + d_{\text{prop}}$$

$d_{\text{trans}}$ : transmission delay:

- $L$ : packet length (bits)
- $R$ : link bandwidth (bps)
- $d_{\text{trans}} = L/R$

$d_{\text{prop}}$ : propagation delay:

- $d$ : length of physical link
- $s$ : propagation speed in medium ( $\sim 2 \times 10^8$  m/sec)
- $d_{\text{prop}} = d/s$

$d_{\text{trans}}$  and  $d_{\text{prop}}$   
very different

\* Check out the Java applet for an interactive animation on trans vs. prop delay

UT/EWI/DACS/PTdB, 20161011

Introduction 1-45  
Pearl 101 - networks :28

## Delays for multiple packets

- ▶ Be very careful when considering the delay of multiple packets.
- ▶ Some delays add up: e.g., next packet can only be transmitted after previous packet's transmission delay has ended.
- ▶ Others don't: e.g., several packets can be propagating on the line simultaneously.  
(compare to cars on a road)

UT/EWI/DACS/PTdB, 20161011

Pearl 101 - networks :29

The screenshot shows the Wireshark interface. The top menu includes File, Edit, View, Go, Capture, Analyze, Statistics, Telephony, Tools, Internals, and Help. The filter bar contains '(tcp.stream eq 1)'. The packet list pane shows four packets:

No.	Time	Source	Destination	Protocol	Length	Info
4	6.0551	177.19.205.114	192.168.22.5	TCP	66	60271 > 8901 [SYN]
5	6.0552	192.168.22.5	177.19.205.114	TCP	66	8901 > 60271 [SYN]
14	6.0572	177.19.205.114	192.168.22.5	TCP	60	60271 > 8901 [ACK]
19	6.4146	177.19.205.114	192.168.22.5	HTTP	1061	GET / HTTP/1.1

The packet details pane for packet 19 shows:

- Frame 5: 66 bytes on wire (528 bits), 66 bytes captured (528 bits)
- Ethernet II, Src: 96:6e:c4:af:e7:11 (96:6e:c4:af:e7:11), Dst: f4:ec:38:f6:86:33
- Internet Protocol Version 4, Src: 192.168.22.5 (192.168.22.5), Dst: 177.19.205.114
- Transmission Control Protocol, Src Port: 8901 (8901), Dst Port: 60271 (60271), Seq: 2648264253, Win: 0, Len: 0

The packet bytes pane shows the raw data in hexadecimal and ASCII:

```
0000 f4 ec 38 f6 86 3a 96 6e c4 af e7 11 08 00 45 00 ..8...n .....E.
0010 00 34 00 00 40 00 06 e5 90 c0 a8 16 05 b1 13 .4..@.@. ....
0020 cd 72 22 c5 eb 6f 9d d9 4e 3d 5c 26 15 0d 80 12 .r".o.. N=&....
0030 39 08 75 46 00 00 02 04 05 b4 01 01 04 02 01 03 9.uF....
```

## Pearl assignments

- ▶ Work with Wireshark: learn more about how the Internet and its protocols work by observing them in action.
- ▶ Use traceroute to map paths through the network.

UT/EWI/DACS/PTdB, 20161011

Pearl 101 - networks :30

## Dat het Trojaans paard in China staat is niet te bewijzen

DE VOLKSKRANT  
DINSDAG 31 MAART 2009

### Achtergrond

▶ Ingenieur virus nestelde zich in computers van dalai lama.

▶ Hackers maakten een fout.

Van onze verslaggever  
Bard van de Weijer

AMSTERDAM Op 25 juli 2008 ontvingt een medewerker van het hoofdkantoor van de dalai lama in het Indiase Dharamsala een e-mail die ogenschijnlijk afkomstig is van de bevriende stichting Free Tibet. Aan het bericht zit een document gehecht met informatie voor Tibetanen in ballingschap. Wanneer de medewerker het document aanklikt, opent Microsoft Word en wordt de tekst getoond.

Wat de medewerker niet weet, is dat het bericht niet afkomstig is van Free Tibet, maar van een hacker. De medewerker merkt even-

paard) is zo slim geschreven dat de meeste antivirusprogramma's het niet weten te onderscheppen.

Na verloop van tijd stuiten medewerkers van de dalai lama op vreemde gebeurtenissen. Een buitenlandse diplomaat die per e-mail is uitgenodigd voor een bezoek, krijgt kort daarna een telefoontje van een Chinese functionaris, die hem afraadt af te reizen.

De organisatie vraagt daarop onderzoekers van onder meer het Canadese Munk Center for International Studies te kijken naar wat er aan de hand is. Uit hun onderzoek blijkt dat onder meer kantoren van de dalai lama in Londen, New York, Brussel en India zijn gehackt. Daarnaast zijn computers van bevriende Tibet-organisaties gekraakt. Maar ook het ministerie van Buitenlandse Zaken van Iran, de ambassade van Roemenië en de ambassade van Zuid-Korea in China blijken geïnfecteerd.

besmetting zit. Om dat te achterhalen, installeren de onderzoekers op getroffen computers het contraspionageprogramma Wireshark. Het blijkt dat gevoelige documenten worden verzonden naar vier centrale internetcomputers, control servers. Met deze servers, die voornamelijk in China staan, kunnen hackers de controle overnemen over alle computers in het besmette netwerk.

De indringers hebben echter een fout gemaakt, waardoor de onderzoekers zich toegang kunnen verschaffen tot de control servers. Zij kunnen nu op hun beurt, zonder dat de hackers het weten, volgen wat er gebeurt.

Veel van de waarnemingen wijzen erop dat de Chinese overheid achter de kraak zit. Maar, stellen de onderzoekers, directe betrokkenheid van Peking is niet te bewijzen. Op internet is het voor kwaadwilligen nog altijd vrij eenvoudig hun
